HYDROMETEOROLOGICAL YEARBOOK 2014

Published by:

Ministry of Environment and Spatial Planning
Environmental Protection Agency of Kosovo
Hydrometeorological Institute of Kosovo (IHMK)

Hydrometeorological Yearbook 2014: Prepared by the Hydrometeorological Institute of Kosovo

The Yearbook was prepared by the following working group:

Eng. dipl./MSc. Letafete Latifi, Director of IHMK
Dr. sci. Bashkim Kastrati, Senior hydrologist in IHMK
Bardhyl Ahmetxhekaj, Meteorologist, Peja station
Beqir Gashi, Meteorologist, Prishtina station
Besim Aliu, Meteorologist, Ferizaj station
Faton Sopi, Database administrator and data quality management
Eng. dipl./MSc. Hasan Hasani, Senior hydrologist
Selim Gjonbalaj, Meteorologist, Prishtina station
Xhevahire Puraj, Hydrologist

This yearbook was generated from MCH database (Meteorological, Climatological and Hydrological Database Management System) provided by WMO (World Meteorological Organization) and used the "Report Generator" software created by Dr. Michael Haase, Center for International Migration and Development (CIM) integrated expert in IHMK – the center is joint cooperation between GIZ and ZAV.

PREFACE

Hydrometeorological yearbook is an important source of information from the hydrometeorological monitoring and observations. Its purpose is to serve as a credible and official base of data for policy makers, public, scientific community and representatives of the private sector, for economic planning and development of the Republic of Kosovo.

Long term hydrological monitoring provides crucial information for planning, construction and operation of management structures of water resources, for discharging of rivers' infrastructures or for making decisions that have good ecological impact. Climatological monitoring and observations, allow to identify climate changes and enables to draft the work plan for Crisis Management from climate change and their adaptation.

Some climatological stations in Kosovo have a long tradition. In the past, climatic data from Pristina, Mitrovica, Peja, Ferizaj and Prizren have been published in meteorological yearbooks on a regular basis since 1949. Some of the stations are in continuous operation since the early years of 1920s and are registered in the World Meteorological Organization's synoptic network.

Kosovo is projected to be severely affected by climate change in the future. Climatological and hydrological processes hence need to be accurately and continuously observed, analyzed and documented. In Kosovo, this task is performed on behalf of Government, by Hydrometeorological Institute of Kosovo. The derived information forms an important data for policy makers of Kosovo in favour of the benefit of its citizens and it helps managers to derive adequate strategies for managing their company.

The hydrometeorological yearbook 2014 of Kosovo is the first one published in Kosovo since the end of the last war, when also the process of reconstruction (recovery) of the institutions began. With the publication of this yearbook, we appreciate the work and commitment of Kosovo Hydrometeorological Institute in fulfilling its professional and legal obligations. Moreover the Institute realizes its objectives in order to inform the public about the hydrological and meteorological situation in Kosovo.

We sincerely thank GIZ (Gesellschaft für Internationale Zusammenarbeit) for financial support for published this yearbook.

Prof. Dr. Ferat Shala

Minister of the Ministry of Environment and Spatial Planning

ACKNOWLEDGMENT

Dear readers and collaborators, you have in your hands the Hydro Meteorological Yearly Book for 2014, containing information on the monitoring of hydrological and meteorological events parameters during this year. Part of the report is also data on the extent of the network of meteorological and hydrological stations in Kosovo.

Yearly book has been prepared on behalf of the activities for the fulfillment of the tasks and responsibilities that IHMK has for reporting and informing on meteorological and hydrological events and on the status of meteorology and hydrology sector. This is the first annual report prepared by the Hydro meteorological Institute of Kosovo, since after the war.

Let's hope that this Yearly Book will be a modest contribution, not only to inform about the hydro meteorological status in Kosovo, but also as a document that will serve the government people in charge to implement sustainable policies in the field of hydrology, meteorology and climate change.

This Yearly Book, among others things will serve as an orientation guide for donors on potential projects that is necessary to strengthen this sector.

On this occasion, I express my gratitude to GIZ not only for supporting this publication, but also for the support to the establishment and strengthening of hydrology and meteorology sector in Kosovo.

Many thanks goes also to the other donors and to all those who contributed in the preparation of this publication.

PhD Ilir Morina

Executive Head of Agency for
Environment Protection in Kosovo

1 Methodology

1.1 The methodology of compiling the yearbook

The yearbook is based on daily, monthly and annual data, which were compiled from the monitoring networks for meteorological, climatological, agrometeorological, and hydrological parameters. These networks are depicted on map 1.1. Explanations of the symbols being used throughout this yearbook are provided in tables 1.1 and 1.2.

Chapters 2 to 5 contain the monitoring network and daily, monthly as well as annual data of the meteorological, climatological and agrometeorological measurements, and as precipitation data for Kosovo which were collected by the monitoring network. The main data sources for meteorological and climatological data are Prishtina, Peja and Ferizaj. Data from Podujevo and Mitrovica are not available continuously because of technical problems with the equipment, it was therefore decided not to publish these data. Data from Dragash and Brezovica are not available to IHMK since the last war.

The data are presented in tabular and graphical form. A detailed analysis was carried out on extreme air temperature values, wind speeds, cloud cover and precipitation. The number of days with precipitation, monthly and annual precipitation as well as days with high precipitation, days with tropical temperatures and the annual sunshine duration were determined. A climatological analysis was carried out for 2014, the most characteristic parameters are presented in tabular form.

The yearbook contains data on precipitation for 2014 as well, which in part are a contribution of volunteers who were not reimbursed for their service. The report tables for precipitation in this yearbook contain daily precipitation values, maximum daily precipitation values per month and monthly precipitation sums as well as the number of days with precipitation.

The Kosovo hydrometric network is presented in the section on hydrology. The section also contains water level data aggregated to daily time steps for eight stations which were in operation in 2014. These stations are: Gryka Rugova - Bistrica river Peja, Gjakova - Erenik river, Prizren - Bistrica river Prizren, Mlik - Brod river, Lluzhan - Lap river, Brod - Lepenc river, Hani i Elezit - Lepenc river and Viti - Morava Binces. The tables presented in this section contain average daily water levels, average monthly values, as well as absolute minimum and maximum water levels per month including corresponding dates of their occurrence. Duration curves based on mean daily water levels are also provided in tabular and graphic form. Further, information on floods and droughts in Kosovo in 2014 is provided. The hydrometric network covers the Drin, Lepenc, Ibri, Morava e Binces and Plava river basins.

Figure 1.1: Station network of the Republic of Kosovo for collecting precipitation as well as meteorological and hydrological parameters

1.2 Statistical evaluation and symbols

The yearbook presents hydrometeorological data aggregated to daily and/or monthly values which were collected on a daily or subdaily basis.

The climatological measurements and observations are carried out at the monitoring locations three times a day at 7, 14 and 21 o'clock local time.

The average daily air temperature value (T_{avg}) is calculated according to the following formula:

$$T_{avg} = \frac{T7 + T14 + 2 * T21}{4} \quad (1.1)$$

The average daily value of all other parameters (X_{avg}) is determined according to this equation:

$$X_{avg} = \frac{X7 + X14 + X21}{3} \quad (1.2)$$

The minimum and maximum air temperatures are read and recorded at 21 o'clock for that day.

Daily precipitation refers to a period of 24 hours which starts at 7 o'clock of the previous day and lasts until 7 o'clock of the next day when the precipitation is recorded and registered.

The average daily values (X_{avg}) from recordings with different time intervals, e.g. recordings of water levels by automatic stations are determined as follows:

$$X_{avg} = \frac{\sum_{i=1}^n (X_i + X_{i+1}) * 0.5 * \Delta t_i}{24} \quad (1.3)$$

Where the sum of all time intervals Δt_i during the day is equal to $\sum_{i=1}^n \Delta t_i = 24$ hours and n is the number of intervals Δt_i during the day.

An explanation (meaning) of the symbols is provided in tables 1.1 and 1.2.

Table 1.1: Symbols and their meaning

Symbol	Meaning
7 14 21	Times of measurement
Air temperature	Air temperature (°C)
Avg	Average value
Cloud cover	Cloud coverage (cloudiness) on a scale of 0 to 10
Cloud cover < 2	Daily average cloud cover (cloudiness) < 2 of 10 (bright day)
Cloud cover > 8	Daily average cloud cover (cloudiness) > 8 of 10 (cloudy day)
Daily extreme temperatures	Maximum and minimum air temperatures within a day in °C
Max	Maximum value
Min	Minimum value
New snow	Newly fallen snow in cm
Precipitation	Precipitation (rain, freezing rain, sleet, snow, or hail) in mm
Precipitation ≥ 0.1	Number of days with precipitation ≥ 0.1 mm
Precipitation ≥ 1	Number of days with precipitation ≥ 1 mm
Precipitation ≥ 10	Number of days with precipitation ≥ 10 mm
SD	Sunshine duration in hours
Std	Standard deviation
Symbol “+”	The same value exists several times in the given time interval, the date indicated refers only to the first occurrence of the value in this time interval
Symbol “-”	There are insufficient data to determine this value
Tavg	Average daily air temperature in °C
Tmax	Average monthly value of maximum daily temperatures in °C
Tmin	Average monthly value of the minimum daily temperatures in °C
Total Snow	Total snow cover in cm
Tn	Minimum daily air temperature in °C
Tn < 0	Number of cold days (minimum daily air temperature < 0 °C)
Tn ≥ 20	Number of days with tropical nights (minimum daily air temperature ≥ 20 °C)
Tn ≤ -10	Number of very cold days (minimum daily air temperature ≤ -10 °C)
Tx	Maximum daily air temperature in °C
Tx < 0	Number of frost days (maximum daily air temperature < 0 °C)
Tx ≥ 25	Number of summer days (maximum daily air temperature ≥ 25 °C)
Tx ≥ 30	Number of tropical days (maximum daily air temperature ≥ 30 °C)
Wind speed > 6	Wind speed > 6 m/s
Wind speed > 8	Wind speed > 8 m/s
Year	Annual value
Σ	Sum

Table 1.2: Wind directions and their abbreviations

Symbol	Wind direction	Sector (°)
N	North	$-11.25 \leq \alpha < 11.25$
NNE	North north east	$11.25 \leq \alpha < 33.75$
NE	North east	$33.75 \leq \alpha < 56.25$
ENE	East north east	$56.25 \leq \alpha < 78.75$
E	East	$78.75 \leq \alpha < 101.25$
ESE	East south east	$101.25 \leq \alpha < 123.75$
SE	South east	$123.75 \leq \alpha < 146.25$

2 Climatology 2014

2.1 Meteorological monitoring network

In the past, IHMK's meteorological network covered the entire territory of Kosovo and has met all requirements of a monitoring network as dened by WMO. This network was completely destroyed during the last war and is being rebuilt from 2000 until now. The current network of meteorological, climatological, agrometeorological and precipitation stations is depicted on map 2.1.

The locations of the meteorological, climatological and agrometeorological stations and the parameters being monitored there are provided in tables 2.1 and 2.2.

Table 2.1: Locations of the meteorological stations

No	Station	Latitude	Longitude	Elevation (m asl)	River basin
1	Brezovica	21° 0' 36.00"	42° 7' 48.00"	915	Lepenc
2	Dragash	20° 23' 24.00"	42° 2' 24.00"	1060	Plava
3	Ferizaj	21° 8' 13.31"	42° 22' 32.45"	578	Lepenc
4	Junik	20° 10' 9.62"	42° 17' 9.60"	618	White Drin
5	Mitrovica	20° 31' 12.00"	42° 31' 48.00"	510	Ibri
6	Peja	20° 18' 18.40"	42° 39' 56.88"	498	White Drin
7	Podujeva	21° 11' 52.40"	42° 56' 1.86"	620	Ibri
8	Prishtina	21° 8' 13.49"	42° 38' 56.36"	573	Ibri
9	Prizren	20° 44' 8.41"	42° 14' 51.04"	402	White Drin

The data from Podujevo and Mitrovica stations are not included in this yearbook because the data collected there were incomplete. There exists no access to data from Dragash and Brezovica stations.

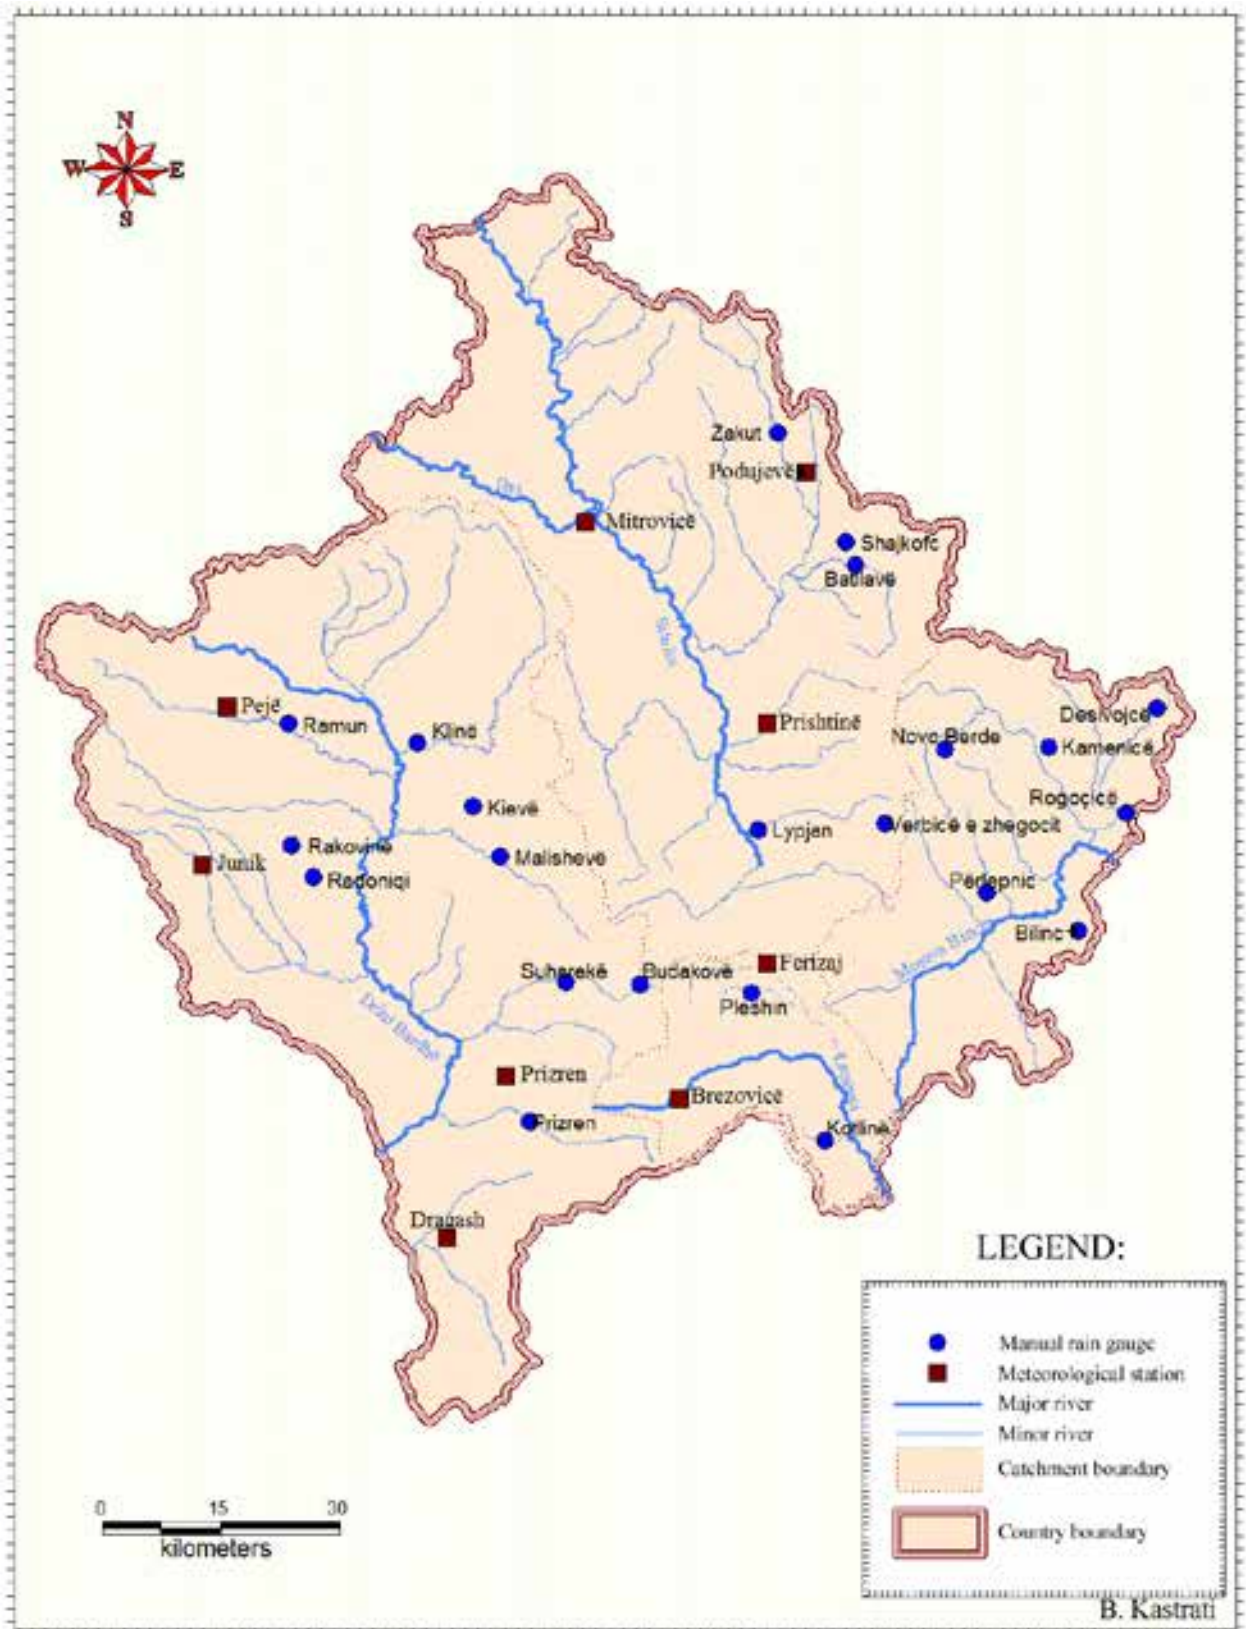

Figure 2.1: Network of meteorological and precipitation recording stations in Kosovo

Table 2.2: Monitored parameters of the measuring stations

No	Station Name	Parameters
1	Ferizaj	Air pressure (hPa), Air temperature-Tavg (°C), Air temperature-Tmax (°C), Air temperature-Tmin (°C), Cloud cover (0-10), Daily precipitation (mm), Snow layer (cm), Wind speed (m/s) and direction (sector)
2	Junik	Air temperature (°C), Daily precipitation (mm)
3	Mitrovica	Air temperature-Tmin (°C), Daily precipitation (mm)
4	Peja	Air pressure (hPa), Air temperature-Tavg (°C), Air temperature-Tmax (°C), Air temperature-Tmin (°C), Cloud cover (0-10), Daily precipitation (mm), Snow layer (cm), Wind speed (m/s) and direction (sector)
5	Podujeva	Automatic station (temperature, air pressure, relative humidity), Daily precipitation (mm)
6	Prishtina	Air pressure (hPa), Air temperature-Tavg (°C), Air temperature-Tmax (°C), Air temperature-Tmin (°C), Cloud cover (0-10), Daily precipitation (mm), Snow layer (cm), Sunshine duration (h), Wind speed (m/s) and direction (sector)
7	Prizren	Air pressure (hPa), Continuous temperature (°C), Daily precipitation (mm), Relative humidity (%)

2.2 Klimatological analysis

From the climatological data analysis presented for the meteorological monitoring stations Prishtina, Peja and Ferizaj, it can be deduced in general that higher monthly average air temperatures T_{max} and T_{min} during the winter season were observed for 2014 in comparison with average air temperatures for the same season during the ten year period from 2004-2013.

The summer season in 2014 is characterized by a slight reduction of T_{max} and T_{min} values in comparison with the average temperature values for the period 2004-2013 for the stations Prishtina (see figures 2.2, 2.3 and 2.4), Peja (see figures 2.5, 2.6 and 2.7) and Ferizaj (see figures 2.8, 2.9 dhe 2.10). It should be noted that during the 2004-2013 period similar values of T_{max} and T_{min} during winter season as depicted for 2014 can only be found for the years 2007 and 2008.

The hottest month in 2014 was August when the maximum daily air temperature reached 34.3 °C in Prishtina, 35.2 °C in Peja and 32.6 °C in Ferizaj. Temperatures dropped to a yearly minimum in Prishtina with -11.4 °C on 30 December, in Peja with -17.0 °C on 7 January and in Ferizaj with -11.6 °C on 31 December. The mean annual temperature is computed to 11.8 °C for Prishtina, 11.8 °C for Peja and 11.2 °C for Ferizaj.

The parameters referred to in this section are explained in table 1.1. From the recorded data at the meteorological stations in 2014 it is deduced that in Prishtina four days were observed with daily maximum temperatures $T_x < 0$ °C, 81 days with daily maximum temperatures $T_x \leq 25$ °C, 19 days with daily maximum temperatures $T_x \geq 30$ °C. No days were registered in Prishtina with a minimum daily temperature $T_n \geq 20$ °C, 46 days were recorded with daily minimum temperatures $T_n < 0$ °C and only three days were registered with minimum daily temperatures $T_n \leq 10$ °C. At Peja meteorological station 16 days were recorded with daily maximum temperatures $T_x < 0$ °C, 88 days with daily maximum temperatures $T_x \leq 25$ °C and 44 days with daily maximum temperatures $T_x \geq 30$ °C. Minimum daily temperatures $T_n \geq 20$ °C were registered at only six days, daily minimum temperatures $T_n < 0$ °C were registered for 70 days and only ten days with daily minimum temperatures $T_n \leq 10$ °C were recorded at Peja station. At Ferizaj five days were registered with daily maximum temperatures $T_x < 0$ °C, 71 days with daily maximum temperatures $T_x \leq 25$ °C and eleven days with daily maximum temperature $T_x \geq 30$ °C. No days were registered with minimum daily temperatures $T_n \geq 20$ °C, daily minimum temperatures $T_n < 0$ °C were recorded on 54 days and two days with daily minimum temperatures $T_n \leq 10$ °C were observed for Ferizaj station. In total, it can be concluded that temperatures for the city of Peja appear to be higher compared to Prishtina and Ferizaj. The sunshine duration for Prishtina for 2014 was determined to 1416.4 hours.

The total annual amount of precipitation recorded in Prishtina in 2014 was 884.9 mm (see figure 2.11), in Peja 771.1 mm (see figure 2.12) and in Ferizaj 863.2 mm (see figure 2.13). The highest precipitation was recorded in April, when precipitation summed up to 218.8 mm (l/m²) for Prishtina, 86.1 mm (l/m²) for Peja and 160.8 mm (l/m²) for Ferizaj. April 2014 was the month with the highest recorded precipitation, whereas during the period 2004-2013 most precipitation occurred in May. In Prishtina 144 days with precipitation, in Peja 149 days with precipitation and in Ferizaj 124 days with precipitation were recorded. It can be stated that Kosovo received sufficient rain in 2014. The latter holds true despite the fact that in March 2014 parts of Kosovo suffered from water shortages (drought) because the previous winter did not provide sufficient precipitation as rain or snow.

The data collected at the meteorological stations in Ferizaj and Peja comply to the standards, which resembles that 99-100 % of the required data were recorded during the year. At Prishtina station data for relative humidity, air pressure, air temperature, sunshine duration, visibility and cloud cover were recorded at 70 % level throughout the year, the standard sets for a 75 % level. Other parameters such as daily maximum and minimum temperatures, wind direction, wind speed, and precipitation were recorded on a 100 % basis over the year for Prishtina.

5 Hydrology 2014

5.1 Hydrologic station network overview

Kosovo has a relatively short history of hydrometric measurements, although the first water level measurements in some rivers of Kosovo date back to 1923. Regular and systematic measurements with an increasing number of hydrological stations, covering the entire territory of Kosovo, began after the Second World War. Initially water level readings were conducted manually from stage boards, later main river profiles were equipped with self-recording limnigraphs. This way with occasional interruptions water level recordings were carried out until the last war. At the end of the last century only ten stations remained functional of originally more than 30 stations.

After the war, the build-up of the hydrometric monitoring network started with 22 stations, which were equipped with automatic pressure sensors for water level recording. Even today the expansion of the hydrometric monitoring network continues. The aim is to improve the spatial coverage of gauging stations of major rivers in Kosovo. In early 2014 only eight hydrometric stations of this network were still fully functioning (see table 5.1). Up to the end of 2015 the existing hydrometric network was expanded up to 27 stations as depicted on map 5.1. Seven of these stations allow for a real-time data access via GPRS from a central server. Two of these stations as well as the soft- and hardware of the server platform were donated by German GIZ (Gesellschaft für Internationale Zusammenarbeit GmbH) in the context of the “Climate change adaptation in the Western Balkans” project, we thank GIZ for this support.

Table 5.1: Operational hydrometric stations during 2014

No	River basin	Station	River	Latitude	Longitude	Elevation (m asl)
1	White Drin	Gryka	Bistrica Peja	20° 15' 4.39"	42° 39' 42.30"	581
2	White Drin	Gjakova	Erenik	20° 25' 13.84"	42° 22' 9.37"	340
3	White Drin	Prizren	Bistrica Prizren	20° 46' 24.85"	42° 11' 39.12"	512
4	Ibri	Lluzhan	Llap	21° 10' 5.34"	42° 49' 9.01"	565
5	Lepenc	Brod	Lepenc	21° 8' 0.56"	42° 16' 21.83"	634
6	Lepenc	Hani i Elezit	Lepenc	21° 17' 49.74"	42° 8' 29.22"	354
7	Morava Binces	Viti	Morava Binces	21° 21' 33.80"	42° 18' 43.27"	543
8	Plava	Mlik	Brod	20° 38' 42.50"	42° 2' 41.93"	980

Figure 5.1: Hydrometric station network of Kosovo

5.2 Hydrological analysis

From the end of 2013 up to beginning of April 2014 Kosovo was hit by a drought. In particular, in February 2014 the situation turned severe with monthly SPI values as low as -2.59 determined for some places. The Standardized Precipitation Index (SPI) is recommended by the World Meteorological Organization to characterize meteorological droughts, SPI values below -2.0 characterize "extreme droughts".

Figures 5.2 to 5.5 depict runo graphs for 2014 of some water level stations in Kosovo against precipitation recorded at the closest precipitation gauging station located to this particular station. In addition, long term averages (dark blue line) and long term fluctuations (light blue polygon) as mainly compiled from historic Yugoslavian yearbooks and datas of HMIK the monitored after the last war, are depicted in these graphs. For some graphs the water levels for 2014 are not complete due to station operation problems.

For Viti, Luzan, and Hani i Elezit a long term rise of water levels from mid April to mid May is observed. This clearly coincides with the high rainfall recorded during this period for the entire Western Balkans which led to severe floods in the region. Floods in Kosovo occurred during this event for instance in the cities of Lipjan, Fushe Kosova, Obilic, Vushtrri, and Mitrovica. One casualty is reported from Sitnica River where a child drowned in the floods in the city of Lipjan in Rufe municipality.

Figures 5.6 to 5.8 depict the temporal development of stored water in Liqeni Badocit reservoir in Basene-Sitnica catchment (Ibri basin) during late winter / early spring 2014. In early February main areas of the reservoir have dried up. During April the reservoir starts to refill and by beginning of May it has been fully recharged.

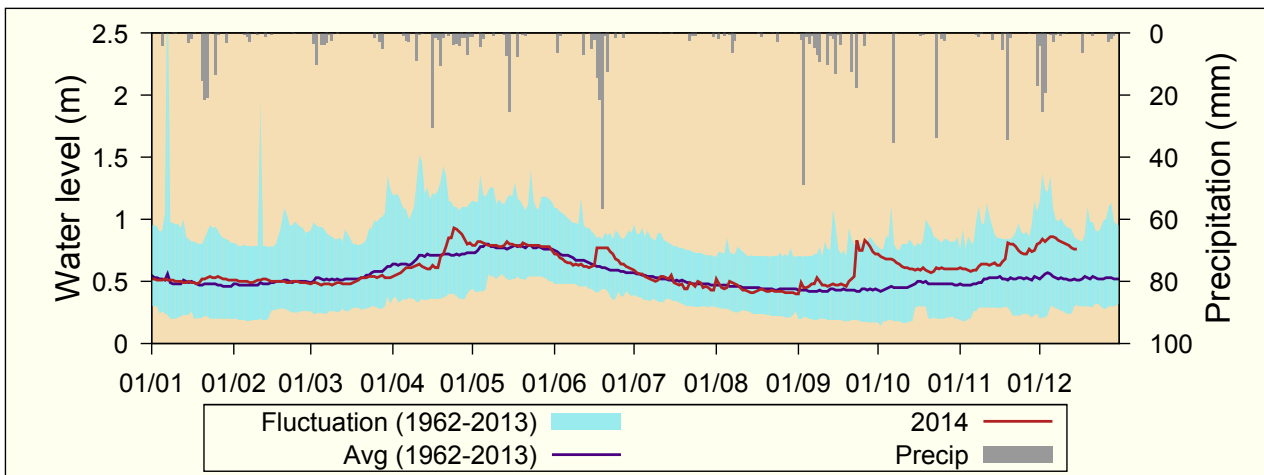

Figure 5.2: Water level at Mlik station (Plava basin) with rainfall from Peja station for 2014

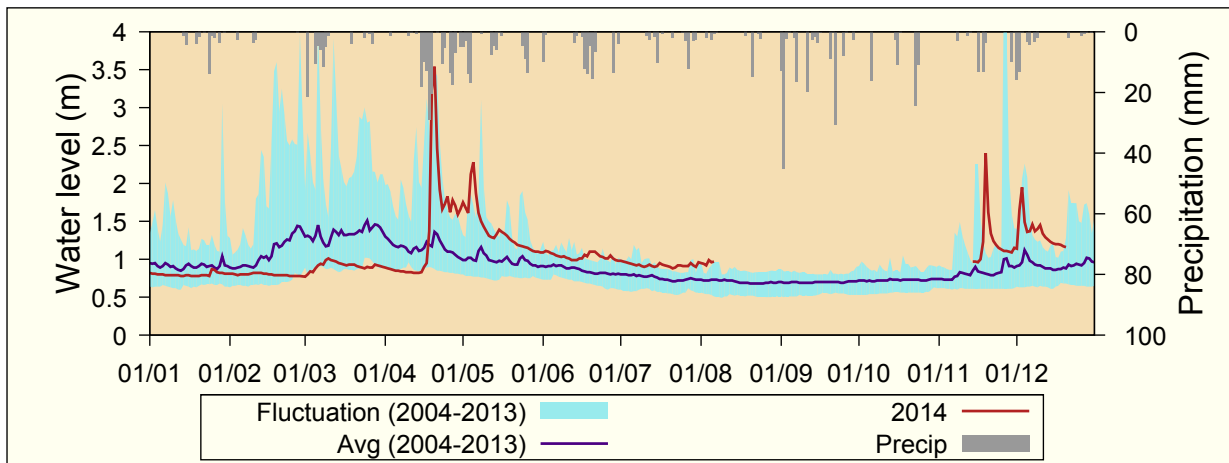

Figure 5.3: Water level at Luzan station (Ibri basin) with rainfall from Zakut station for 2014

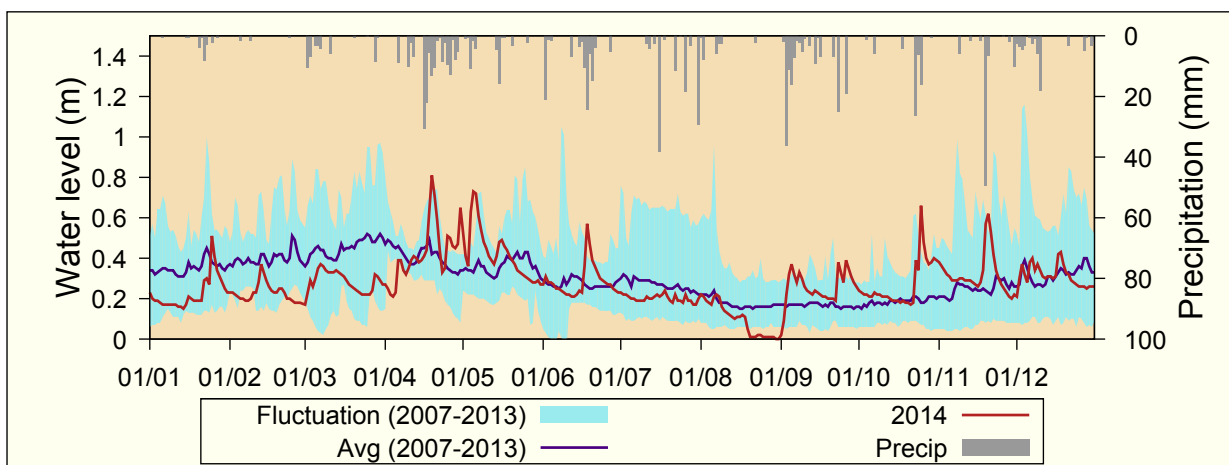

Figure 5.4: Water level at Viti station (Morava Binces basin) with rainfall from Ferizaj station for 2014 (the sensor most likely fell dry during late August)

5.10 Viti

Water level (m): 2014

River basin: Morava Binces

River name: Morava Binces

Station altitude: 543 m asl

Distance to mouth: 313 km

Catchment area: 11.2 km²
