Hidrometeorološki godišnjak - 2024: Pripremio Hidrometeorološki zavod Kosova (HMZK)

Pripremu godišnjaka izvršili su:  
Armend Aguši, direktor  
Dr. sc. Bashkim KASTRATI, viši hidrolod  
Dipl. inž./msc. Hasan HASANI, viši hidrolod  
Msc. Besim ALIU, meteorolog u HMZK, stanica Uroševač  
Xhevahire PURAJ, hidrolod  
Faton SOPI, službenik za bazu podataka i IT administraciju  
Beqir GASHI, službenik za meteorologiju, stanica Priština  
Bardhyl AHMETXHEKAJ, meteorolog, stanica Peć

Ovaj godišnjak je generisan iz baze podataka HMZK/Meteorološkog informacionog sistema klimatologije i hidrolodije, putem softverskog programa MCH za skladištenje i obradu podataka iz meteorologije, klimatologije i hidrolodije.

Svi korisnici hidrometeorološkog godišnjaka treba da navedu izvor informacija (u hidrometeorološkom godišnjaku - 2024).

# **1 Metodologija**

## 1.1 Metodologija sastavljanja godišnjaka

Sastavljanje godišnjaka je urađeno analizom dnevnih, mesečnih i godišnjih vrednosti meteoroloških, klimatoloških i agrometeoroloških elemenata i pojava, kao i podataka iz hidrološke mreže za praćenje. Gore pomenute mreže su prikazane na mapi 1.1. Objašnjenja simbola korišćenih u ovom godišnjaku data su u tabelama 1.1 i 1.2.

Poglavlja od 2 do 9 sadrže mrežu za praćenje i dnevne, mesečne i godišnje podatke o meteorološkim, klimatološkim, agrometeorološkim parametrima, kao i količini padavina na Kosovu prikupljene iz redovnog praćenja. Glavni izvor podataka za meteorologiju i klimatologiju su meteorološke stanice u Uruševcu, Peći, Prizrenu, Prištini, Šajkovcu, Istoku, Kamenici, Mališevu i Mitrovici. Detaljna analiza je izvršena o vrednostima ekstremne temperature vazduha, brzine vetra, oblačnosti i padavina. Mesečna i godišnja količina padavina, broj dana sa padavinama, kao i broj dana sa visokim intenzitetom padavina, dana sa tropskim temperaturama i godišnje trajanje sunčanog sijanja su određeni i prikazani u tabelarnom obliku, dok su neki od najkarakterističnijih parametara predstavljeni i u grafičkom obliku.

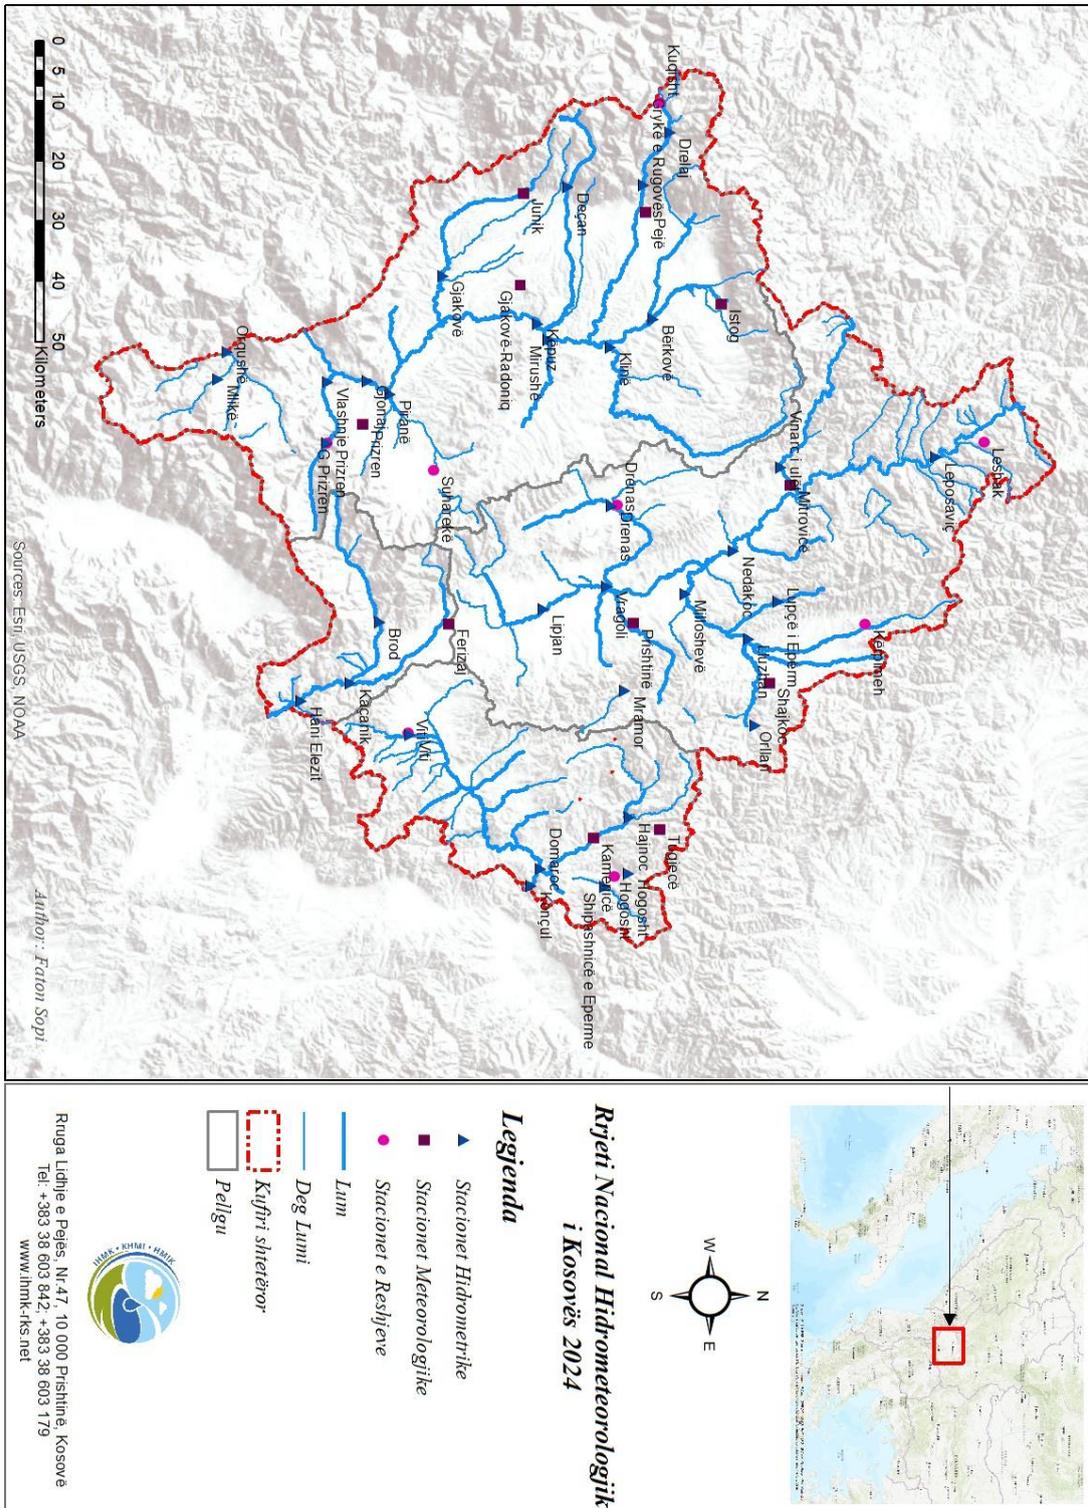

Godišnjak takođe sadrži rezultate praćenja suše/vlažnosti za Kosovo na osnovu Standardizovanog indeksa padavina (SPI). Prostorna interpolacija je izvršena iz podataka prikupljenih/zabeleženih od strane stanica za merenje padavina i predstavljena je na mapi, radi lakšeg pristupa i pregleda stanja uslova suše/vlažnosti za 2024. godinu na Kosovu.

Poglavlje o hidrologiji opisuje državnu hidrometrijsku mrežu, koja pokriva rečne slivove Belog Drima, Ibra, Binačke Morave i Lepenca. Poglavlje takođe sadrži podatke o nivoima (H) prikupljene vode na dnevnoj bazi za 27 stanica, kao i podatke o protoku (Q) za 7 hidroloških stanica za praćenje.

Tabele predstavljene u ovom poglavlju sadrže prosečne dnevne i mesečne nivo vode, kao i apsolutni minimalni i maksimalni vrednosti nivo vode za mesec, uključujući odgovarajuće podatke za njihovo predstavlanje. Krive trajanja su zasnovane na prosečnim dnevnim nivoima protocima vode i date su u tabelarnom i grafičkom obliku.

Takođe, date su informacije o pojavi ekstremnih vremenskih uslova (poplave/bujice) na Kosovu za 2024. godinu.

Tokom 2024. godine, na Kosovu je izdato samo 1 obaveštenje i izveštaj o poplavama.

## 1.2 Statistička obrada podataka

Godišnjak sadrži hidrološke i meteorološke podatke prikupljene za svaki dan i/ili mesečne vrednosti koje se prikupljaju na dnevnoj ili detaljnoj osnovi.

Klimatološka merenja i posmatranja na lokacijama za praćenje vršena su tri datuma: 7, 14 i 21. po lokalnom vremenu.

Prosečna dnevna vrednost temperature vazduha ( $T_{mes}$ ) izračunata je prema jednačini:

$$T_{mes} = \frac{T7 + T14 + 2 * T21}{4} \quad (1.1)$$

Prosečna vrednost relativne vlažnosti ( $X_{mes}$ ) i ostalih parametara izračunava se prema jednačini:

$$X_{mes} = \frac{X7 + X14 + X21}{3} \quad (1.2)$$

Minimalne i maksimalne temperature se očitavaju u 21:00 sat i beleže za taj dan.

Dnevne količina padavine se odnose na period od 24 sata, od 7:00 prethodnog dana do 7:00 tekućeg dana kada se beleže padavine.

Prosečne dnevne vrednosti ( $X_{mes}$ ) iz snimanja sa različitim vremenskim intervalima, npr. snimanje nivoa vode na automatskim stanicama, za razliku od onih gore navedenih, izračunavaju se na sledeći način:

$$X_{mes} = \frac{\sum_{i=1}^n (X_i + X_{i+1}) * 0.5 * \Delta t_i}{24} \quad (1.3)$$

Kada je zbir svih vremenskih intervala  $\Delta t_i$  tokom dana jednak  $\sum_{i=1}^n \Delta t_i = 24$  sata i  $n$  je broj vremenskih intervala  $\Delta t_i$  u satima unutar dana.

Opis (značenje) simbola je predstavljen u tabelama 1.1 i 1.2.

## **3 Praćenje suše**

## 3.1 Standardizovani indeks padavina

Suša je produženi period sa vrlo malo ili bez padavina, što dovodi do nedostatka vode u zemljištu, rekama i akumulacijama. Suša na Kosovu postaje sve ozbiljniji problem, posebno u kontekstu klimatskih promena.

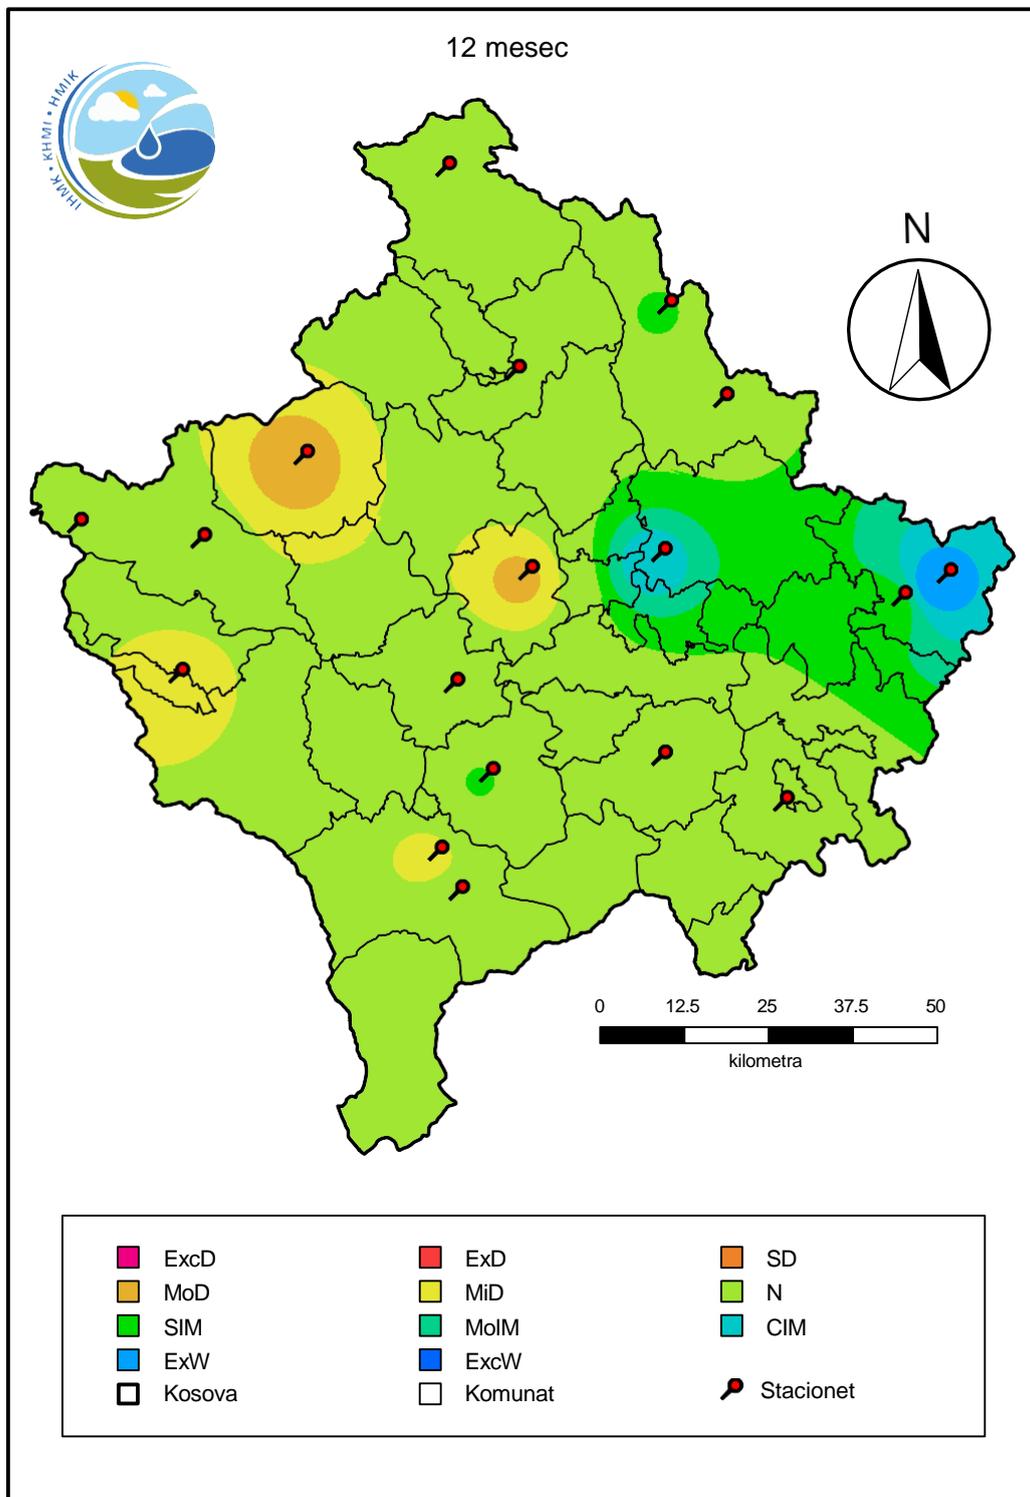

Od 2015. godine, institut je uspostavio program praćenja suše zasnovan na Standardizaciji indeksa padavina (SPI) izračunatog na osnovu količine padavina praćenih na 18 lokacija za praćenje. SPI preporučuje Svetska meteorološka organizacija (SMO) kao standardni alat za praćenje suše. Relativno ga je lako pratiti, jer su za analizu potrebni samo podaci o padavinama, koje prikuplja i analizira Hidrometeorološki institut Kosova prema standardima. Vrednosti SPI se redovno određuju za periode od jednog, dva, tri, četiri, šest i dvanaest meseci za lokacije merenja padavina na Kosovu. Rezultati se prostorno interpoliraju i prikazuju na mapama. Analiza se zasniva na pretpostavci da hidrološka godina počinje u oktobru i završava se u septembru sledeće kalendarske godine.

Svetska meteorološka organizacija preporučuje da se vrednosti SPI klasifikuju u sedam klasa, od „ekstremno vlažno“ do „ekstremno suvo“. Nakon projekta Evropske unije u regionu, usvojena je klasifikacija od jedanaest klasa za praćenje stanja vlažnosti (suvoće) putem SPI. Tabela 3.1 opisuje granice odgovarajućih klasa. Na osnovu toga, ažurirani podaci SPI objavljeni su kao mape na veb stranici instituta (<http://www.ihmk-rks.net>).

**Tabela 3.1: Kategorija uslova vlažnosti na osnovu SPI**

| Simboli | Uslovi vlažnosti             | Vrednost                   |

## **2 Praćenje padavine 2024**

## 2.1 Mreža za praćenje padavina

Praćenje padavina je od posebnog značaja za svaku analizu vodnog sistema i za operativnu kontrolu voda, kao i za klimatske studije. Tradicionalno, padavine se mere pomoću kišomera koji ručno očitanih i automatskih kišomera koji šalju podatke u realnom vremenu na centralni server (bazu podataka) koristeći bežičnu GPRS komunikaciju. To je dokazana tehnologija koja dobro funkcioniše za praćenje padavina u područjima praćenja.

Hidrometeorološki zavod Kosova poseduje mrežu za praćenje padavina koja trenutno sadrži ukupno 18 pluviometrijskih stanica (kišomera), raspoređenih širom teritorije Republike Kosovo. Od ovih stanica, 9 je integrisano u meteorološke stanice, videti mapu 1.1, i automatski mere padavine beležeći njihovu količinu i intenzitet, dok su ostalih 9 stanica ručno očitani kišomeri, videti mapu 5.1.

# 4 Hidrologija

## 4.1 Hidrološka mreža Kosova

Državna hidrometrijska mreža je sistem stanica koje prate i mere količinu vode u rekama i drugim vodama unutar države. Preko ove mreže se vrše merenja nivoa vode i protoka, sa ciljem kontrole vodnih resursa, kao i predviđanja i sprečavanja poplava.

Reke Kosova se ulivaju u tri (3) morskog sliva: Jadransko more (43,5%), Crno more (50,7%) i Egejsko more (5,8%), dok je njegova teritorija podeljena na pet (5) rečnih sliva: sliv Belog Drima, sliv Ibra, sliv Binačke Morave, sliv Lepenca i sliv Plava.

Sliv Belog Drina pripadaju sledeće reke : Ereniku, Bistrica e Decanit, Bistrica e Pejes, Bistrica e Prizrenit, Topluha, Mirusha, Klina, Istog, itd.

Sliv Ibra obuhvata reke: Sitnicu sa glavnim pritoka (Drenica, Lapi) itd.

Sliv Binačke Morave obuhvata reke: Kriva Reka sa pritokama : L. Desivojca, Hogosht, Kremenate itd

Sliv Lepenca obuhvata reku Nerodimku.

Sliv plave obuhvata reke: Brođi, Restelicu itd.

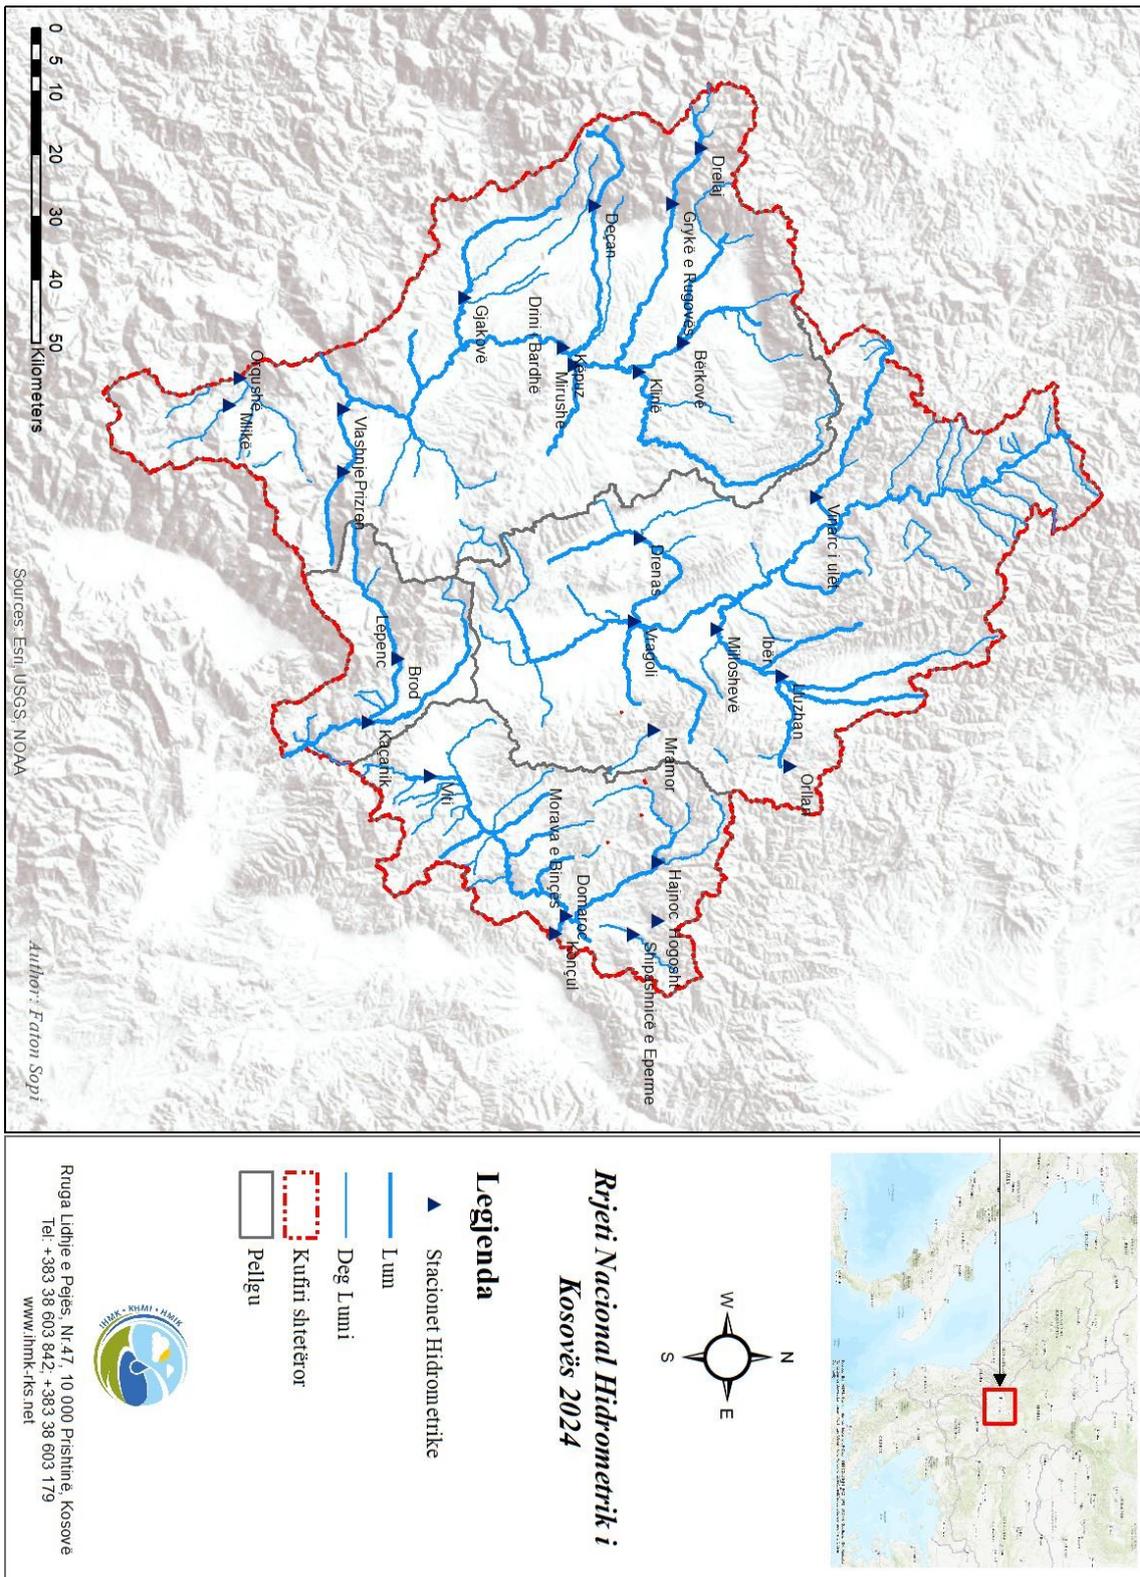

Mreža hidroloških stanica je raspoređena na način koji obezbeđuje dobru pokrivenost svih gore pomenutih rečnih slivova i sastoji se od 24 redovne monitoring stanice i 3 posebne monitoring stanice za studiju izvodljivosti izgradnje brane u hidrosistemu Kike - Kremenate. Stanice su opremljene automatskim senzorima pritiska i letvama za snimanje nivoa vode (videti tabelu 7.1, 7.2 i sliku 7.1). Dvadeset četiri (24) stanice iz redovne monitoring mreže i tri (3) posebne monitoring stanice omogućavaju pristup podacima u realnom vremenu putem GPRS-a sa centralnog servera. Podaci sa ovih onlajn stanica se snimaju u intervalima od 15 minuta, dok se podaci sa ostalih 20 stanica monitoring mreže snimaju u intervalima od 60 minuta. Najnoviji podaci sa onlajn stanica objavljeni su na veb stranici Hidrometeorološkog zavoda, videti link: <http://ihmk-rks.net>.
